Name three reasons why it is important to have knowledge of information technology (IT) and information systems (IS).

Maximum 150 words.

IT and IS consideration

It is widely known our interconnected world concerns new challenges and disruption points, hence in this essay, we will discuss three reasons to keep informed about information technology (IT) and systems (IS), which are:

These technologies bring us higher operational efficiency and better decision-making. Understanding them enables both individuals and organizations, to automate repetitive and redundant tasks, optimize business workflows, and analyze real-time data to develop more robust and evidence-based strategies.

Furthermore, that technologies knowledge provides us essential competitive advantage and precise professional development. Digital domain using modern systems allows professionals to adapt to market fluctuations, drive innovation, and remain highly competitive in an increasingly unstable economy.

Moreover, that underlying knowledge leads us to be aware of cybersecurity and its risk management, controlling inherent threats, compliance standards and privacy protocols.

In conclusion, the benefits far outweigh the risks. Making continuous learning turns into crucial.

Name three reasons why it is difficult or complex to manage information systems.

Maximum 150 words.

To begin with, there are some difficulties or complexities when we try to manage information systems, hence we are going to consider three of them.

First and foremost, a relevant factor to consider is an increasing amount of data, which significantly increases our resources consumption when processing.

Furthermore, another essential factor is protecting data and maintaining its integrity, as cybercriminals could attempt to exploit its vulnerabilities and steal contained sensitive data.

Last but not least, there is another factor to consider which is its accessibility. When we want to manage some data, this has to be accessible from anywhere it is needed.

In conclusion, taking these three aspects into consideration allows organizations to enable functionalities while minimizing associated risks.

In this course, we use the definition of digital transformation proposed by Vial (2019).

Name one difference and one similarity between the textbook definition of 'digital transformation' and the definition given by Vial in the introduction to his 2019 article.

Maximum 150 words.

There are key similarities and differences between the digital transformation definitions provided by Vial and the textbook.

First and foremost, we are going to consider their similarity, which is: Both definitions view digital transformation as an ongoing, process-oriented effort aimed at improving organizational operations, enhancing performance, and evolving business models/processes over time.

On the other hand, we are going to highlight their difference, which implies that: The textbook definition focuses primarily on business-level outcomes (accelerating existing processes and developing new business models), whereas Vial's definition emphasizes the technological mechanisms driving the change, specifically highlighting how combinations of computing, communication, and connectivity technologies trigger significant alterations to an entity.

In summary, while both agree on the structural impact of transformation, Vial emphasizes the underlying technical drivers, whereas the textbook emphasizes operational acceleration and business strategy.
