

Week 1	
Objetives	We will use this week to get used to the material of the subject, particularly with the tool we will use during the course: preferably the CalcME calculator. We will also begin to read the first module.
Session 1	We will do the two first activities of the CalcME material. The part «CalcME Documentation» is mainly descriptive and presents the CalcME calculator. But it also shows a very useful particular aspect: how to save a work session in order to load it and continue it at another time, or even use it in order to consult the professors of this course. Try to remake the tasks done with CalcME.
Session 2	Today we will work through the first part of the “Basic Guide to CalcMe” material from CalcME. The activities we will work on will allow you to see the potential of CalcME as a graphing calculator and as a symbolic calculator for solving equations. In this case, it will be very useful to try to reproduce the examples, as they are very specific and you will most likely be able to complete them successfully.
Session 3	Today we will work through the first part of the “Basic Guide to CalcMe” material from CalcME. The activities we will work on will allow you to see the potential of CalcME as a graphing calculator and as a symbolic calculator for solving equations. In this case, it will be very useful to try to reproduce the examples, as they are very specific and you will most likely be able to complete them successfully. Today we will complete any sections of the “Basic Guide to CalcMe” material from CalcME that you have not yet finished. You will see the versatility of CalcME’s geometric graphics and how easily they can be made interactive, adding value to your learning in the “Graph” section. Reflect on the fact that carrying out geometric constructions and doing analytical geometry are equivalent when using CalcME (“Geometry”). To finish the session, it would be useful to redo the examples from this activity and any that you still have pending. Take a look at the UOC CalcME Guide; it will be very helpful throughout the course. To begin with the course content, you can watch the video “Complex Numbers”, which introduces the definition of complex numbers, their rectangular and polar notation, as well as the basic operations that can be performed in each notation. We will then read Section 1, “Numbers”, of the course material. It is very straightforward, but you should remember the concepts presented there. Review the definitions of the different sets of numbers. It is important to clearly understand the definition of each set (natural, integer, rational, and real numbers). You should understand which numbers belong to one set but not to another.
Keep in mind	Try to use this week to do the three programmed sessions, since the next few weeks you will be very busy with the following sessions!
