

Week 5	
Objectives	We have three main objectives for this week: Master Gauss method for solving of SLE. Master Cramer's method for solving SLE. Solve the third questionnaire of Challenge 2.
Session 13	In this first session we will learn how to solve SLE using Gauss method (section 6). It is a very simple method that transforms, using elementary transformations, the original SLE into an equivalent SLE easily solvable. Read carefully examples 7 and 8. Do exercises 1, 4, 5 and 6. Remember to check your results using CalcME.
Session 14	Today we will use Cramer's method for solving SLE (section 7). Remember the expression 7 when computing the unknowns vector. Re-do example 9 carefully. The observation in this section is very important when using Cramer's method solving a SLE. Examples 10 and 11 should be perfectly understood. In order to practice with Cramer's method you should re-do the part of the resolution in exercises 5 and 6. Do exercises 10, 11, 13, 14 and 15 by yourselves, and check your results using CalcME.
Session 15	This session doesn't have any specific program. You should try to answer any doubt you still have from this Module, and do a final review of it in order to strengthen your learnt knowledge. If you already finished all the work, you can continue with next week's program.
Keep in mind	Continue trying to do the exercises by yourselves, not looking at the resolution until you finish them. Do and re-do the exercises as many times as you need. Remember that you have to solve the third questionnaire of Challenge 2 this week.
