

Week 6	
Objectives	Our main objective this week is to understand the geometrical interpretation of SEL. You should also solve the fourth questionnaire of Challenge 2
Session 16	In order to finish module 3, we will study in section 8 the geometric interpretation of LSE. First try to remember the situation on the plane when we only have 2 unknowns. The key point is to remember (as we did in section 5.3 of the second module with the general equation of a plane in the space) that the solutions of a linear equation with three unknowns can be interpreted as points of a plane. Therefore, the interpretation of a SLE will always be the intersection of different planes, and will mainly consist of the study of their relative position. Try to solve exercises 9 and 12. Review examples 12 to 17 in detail, because you'll learn here the different situations you can have. Observe that every case will depend on the rank of the associated matrices. You should perfectly understand exercises 7, 18 and 20. Try to use CalcME whenever necessary.
Session 17	You should use this session to solve the fourth questionnaire of Challenge 2. Remember that questionnaires are used to compute your grade in the continuous evaluation!
Session 18	This session doesn't have any specific program. You should try to complete all the parts you didn't finish in this challenge. You should also try to review deeply the sections we studied in the previous sections in order to consolidate the knowledge you learnt here. Today is a good time to try doing one of the videos explaining an exercise. You should make good use of these sessions to train for the Synthesis CAT video
Keep in mind	Don't hesitate investing as much time as you need in session 16. Some concepts aren't easy to fully understand, and you might need more time than you previously imagined, but your effort here will be important in the next challenges. Don't forget to finish the fourth questionnaire of Challenge 2!
