Approach to case-based questions

A good way to tackle a case-based question is to follow these steps:

1. **Summarise theory**
   Explain the theoretical concept(s) involved and what is meant by it.

2. **Collect data**
   Read the case description/example and highlight the passages related to the question.

3. **Organise data**
   Structure or organise the data from step 2. You can organise, for example, by specific aspects of the theoretical concept or by parts of the question.

4. **Formulate an answer to the question**
   Use the organisation of data from step 3 to write an explicit and substantiated answer to the question.

Draw conclusions about recognising/not recognising the theoretical concepts and substantiate the conclusions with data from the case study.

Assessment criteria on examination for this type of questions:

- **Completeness:** Does the elaboration explicitly answer the question and elaborate all parts of the question?
- **Alignment with the course theory:** Does the interpretation of concepts correspond to the theory in the course?
- **Justification:** Is the answer to the question clearly and logically justified?
