Your Answers:

1 point possible Essay

List and briefly describe in your own words the different types of deliberate threats mentioned in Section 4.3 of the textbook.

Maximum 500 words.

Deliberate threats are intentional actions meant to harm, steal, or compromise an organization's information systems. The main types include:

- Espionage or Trespass: Unauthorized access to a company's facilities or digital systems to obtain trade secrets, intellectual property, or confidential business data.
- Information Extortion: Threatening to steal, expose, or destroy critical data unless a ransom is paid (e.g., ransomware attacks).
- Sabotage or Vandalism: Acts designed to deliberately damage, deface, or destroy a system, network, or website to disrupt operations or ruin an organization's reputation.
- Theft of Equipment or Information: Stealing physical hardware (like laptops or servers) or stealing digital assets, user data, or intellectual property.
- Identity Theft: Illegally acquiring and using someone’s personal identifying information (like SSNs or financial credentials) to commit fraud or impersonate them.
- Compromises to Intellectual Property: Copying, distributing, or using copyrighted software, trade secrets, or patented materials without authorization (e.g., software piracy).
- Software Attacks: Malicious code designed to infect or disrupt systems. This includes malware (viruses, worms, Trojan horses), denial-of-service (DoS) attacks that overload servers, and phishing schemes designed to trick users into revealing credentials.

- Alien Software: Unwanted software installed on a system without the user's explicit consent, such as spyware, adware, or keyloggers that monitor activity or gather marketing data.
- Supervisory Control and Data Acquisition (SCADA) Attacks: Cyberattacks targeting physical infrastructure controls (like power grids, water treatment plants, or manufacturing assembly lines) to cause operational failure or physical damage.
- Cyberterrorism and Cyberwarfare: State-sponsored or politically motivated attacks aiming to cause severe economic disruption, panic, or harm to critical national infrastructure.

2 1 point possible Essay

One of the deliberate threats mentioned in Section 4.3 is information extortion. A serious form of information extortion is ransomware. The textbook gives some examples of ransomware attacks in the US (IT's About Business 4.2, pages 100-101).

What is ransomware?

Maximum 100 words.

Ransomware is a type of malicious software (malware) that encrypts a victim’s files or locks their entire computer system. The attacker then demands a ransom payment (typically in cryptocurrency) from the owner in exchange for the decryption key needed to unlock and restore access to their data.

3 1 point possible Essay

Explain why has ransomware become a serious problem.

Maximum 100 words.

Ransomware has become a major threat due to several factors:

- High Profitability: Attackers can easily collect large sums of money with low operational costs.
- Cryptocurrency Anonymity: Digital currencies like Bitcoin make payments hard for law enforcement to track.
- Ransomware-as-a-Service (RaaS): Pre-built kits allow unskilled criminals to launch sophisticated attacks easily.
- High Impact: Organizations face immediate operational shutdown, data loss, and severe reputational damage, forcing many victims to pay the ransom to resume critical operations quickly.
